

Configuration Manual

This manual explains how to set up, customise, and manage software or system configurations within the portal. It provides clear steps so users can adjust settings confidently and maintain consistent operation.

1. Purpose of Configuration

Configuration allows users to tailor system behaviour, enable or disable features, adjust preferences, and ensure the setup aligns with operational requirements. Proper configuration improves performance and reduces errors.

2. Accessing Configuration Settings

- Log into the portal with the correct user role or permissions.
 - Navigate to the settings or administration section.
 - Select the module or component you want to configure, such as user accounts, notifications, workflows, or integrations.
-

3. System Preferences

- Adjust general preferences like language, time zone, display options, and layout.
 - Review accessibility settings to match user needs.
 - Save changes and verify that updates reflect across the portal.
-

4. User and Role Configuration

- Create or modify user accounts as required.
 - Assign appropriate roles and permissions based on responsibilities.
 - Set access limits for sensitive data or restricted tools.
 - Deactivate or archive unused accounts to maintain security.
-

5. Workflow and Automation Settings

- Define approval paths, notifications, and triggers for key actions.
- Configure automated steps for tasks such as reminders, updates, or escalations.

- Test workflows to ensure smooth operation before activating them.
-

6. Integration Settings

- Enable or disable third-party integrations such as APIs, reporting tools, or authentication services.
 - Enter required credentials, tokens, or endpoints where necessary.
 - Confirm connectivity and test data flow to avoid disruptions.
-

7. Security and Compliance

- Configure password policies, session timeouts, and access restrictions.
 - Review audit logs for any irregular activity.
 - Ensure all configurations meet internal security policies and regulatory requirements.
-

8. Saving and Validating Changes

- Apply changes and wait for the confirmation message.
 - Verify updated behaviour through quick functional tests.
 - Document any major configuration adjustments for future reference.
-

9. Reset and Recovery Options

- Use the reset feature if incorrect settings cause system instability.
- Restore previously saved configuration profiles when necessary.
- Contact admin support if the system becomes unresponsive after configuration updates.
