

Emergency Procedures

1. Recognising an Emergency

Here's the thing—most issues give you a bit of warning before they turn into a problem. If you notice smoke, burning smells, sudden loss of power, overheating, or any unusual noise, treat it as an emergency. Stop using the equipment right away. Don't try to troubleshoot on the spot if the situation looks unsafe.

2. Immediate Steps to Stay Safe

Let's break it down into quick, clear actions:

Power Off

If the system is still running, shut it down through the main switch or control interface. If that's not possible, disconnect the power source manually.

Move Away from the Equipment

Give yourself a safe buffer. Electrical and mechanical faults can escalate fast. If you're indoors, step back and make sure nothing combustible is nearby.

Stop Others From Approaching

Even if the issue looks small, keep others at a safe distance until you know the equipment is no longer a threat.

3. Fire or Smoke

What this really means is you should act quickly but avoid panic.

- Cut power immediately.
- If there's visible smoke or sparks, do not touch the device.
- Use a Class C or general-purpose fire extinguisher if flames appear.
- If you don't have the right extinguisher, leave the area and call emergency services.

Never use water on electrical equipment. It makes the situation worse.

4. Electrical Shock Situations

If someone receives an electric shock:

- Do not touch them until the power source is disconnected.
- Turn off the breaker, unplug the device, or move the cable away using a non-conductive object.

- Once safe, check their breathing and pulse.
- Call emergency services immediately.
- Keep the person still until help arrives.

5. Overheating or Burning Smell

Most of the time, overheating is caused by airflow issues or internal faults.

- Power off the system.
- Allow everything to cool down naturally.
- Do not try to open or service the equipment yourself while it's hot.
- Contact technical support before restarting the system.

6. Fluid Leaks

If you notice any kind of leakage:

- Shut down the device.
- Avoid touching the fluid until you know what it is.
- Wipe only if the area is safe and dry.
- Report the issue to maintenance or support.

7. Emergency Contact Steps

Keep these actions simple and consistent:

- Report the incident to your supervisor or support team.
- Note what happened, when it started, and any warning signs you saw.
- Do not restart or move the equipment until someone qualified checks it.

8. After the Emergency

Once things calm down, your focus is preventing a repeat.

- Document the event clearly.
- Remove the equipment from active use until cleared.
- Follow any repair, replacement, or inspection instructions from support staff.
- Update your team so everyone knows what happened and what to avoid next time.
