

Mobile App Instructions

Getting Started

Here's the thing: the app is built to be simple. Download it from your platform's store, install it, and open it once to initialize your profile. The first screen asks you to log in with the same credentials you use for the main portal. Once you're in, the app syncs your account settings automatically, so you don't need to set anything up manually.

Home Screen Walkthrough

The home screen works as your quick dashboard. You'll see your device or equipment status, recent notifications, and shortcuts to the most used actions. If you tap on any card, it takes you straight to the detailed page without extra menu crawling.

Navigation

Swipe from the left to open the navigation panel. Everything is grouped in plain language:

- Device or equipment overview
- Activity logs
- Service and maintenance
- Settings
- Support

Whatever you open last stays in memory, so the app brings you back to it when reopened.

Device Management

What this really means is you can check live status, view recent events, and update configurations from your phone. Each device has a dedicated page with three areas:

- Overview with current state
- History
- Actions like updates, resets, and diagnostic requests

Nothing is hidden. If a feature needs admin access, the app will ask for confirmation.

Notifications

The app pushes important alerts instantly. Fault codes, service reminders, updates, or anything urgent lands in the notification tray. Tapping a notification brings you directly to the relevant section so you don't hunt for context.

Service & Maintenance

This section gives you quick access to scheduled service reminders and past service logs. You can mark tasks as completed, check pending items, and contact support if something needs escalation. It mirrors the portal but in a lighter format.

Updates

When there's a software or firmware update available, the app notifies you. You'll see a short description of what's new, and you can start the update right from your phone if supported. Progress is shown with simple status steps.

User Settings

This is where you adjust profile details, app preferences, and notification rules. The options are straightforward: choose what alerts you want, change display settings, and manage connected devices.

Support & Help

If something goes wrong, open the support section. You'll find quick actions like initiating a diagnostic scan, sending logs to support, checking common issues, or contacting the service team.
