

Storage Procedures

These procedures explain how to store the system, accessories, and related components so they stay reliable over the long term. Proper storage prevents damage, avoids performance issues, and keeps everything ready for use whenever it's needed.

1. Prepare the equipment before storing

Before putting anything away, make sure the system is clean and dry. Wipe off dust, fingerprints, or moisture. Power the device down fully and disconnect any external cables. If the accessory uses removable parts or modular components, secure them so they don't shift during storage.

2. Choose the right environment

Stable conditions matter more than most people realise. Store equipment in a cool, dry place with good airflow. Avoid areas with direct sunlight, high humidity, or drastic temperature swings. Basements, attics, and rooms with fluctuating heat often cause corrosion, warping, or electronic degradation.

3. Protect the device from dust and impact

Use protective covers, soft pouches, or the original packaging when possible. Padding reduces the risk of scratches or physical stress. Even small shocks can damage sensitive components, especially if the device remains stored for long periods. Keep the equipment off the floor and away from heavy items that could fall onto it.

4. Store batteries correctly

If the device runs on internal or removable batteries, avoid storing it at full or completely empty charge. A moderate level is ideal. Check the battery every few months so it doesn't discharge to unsafe levels. For accessories with removable batteries, store them separately to reduce stress on the device.

5. Handle cables and connectors carefully

Wrap cables loosely instead of bending them tightly. Sharp bends and excessive tension cause internal wire fatigue. Keep connectors capped or covered to prevent dust buildup. Store cables in a dry space so the insulation doesn't degrade over time.

6. Keep moisture away

Condensation is one of the biggest threats to stored electronics. If the area is prone to humidity, use a small desiccant pack or moisture absorber near the equipment. Avoid sealed, non-ventilated containers unless you've added something to control moisture inside.

7. Long-term storage considerations

For long-term storage, check the equipment periodically. Power it on briefly every few months to ensure components still function. This keeps internal systems active and

prevents deep discharge issues. If any part feels unusually warm, swollen, or stiff, address it before returning the equipment to storage.

8. Label and organise components

When storing multiple accessories or spare parts, keep them grouped logically. Label boxes or containers so nothing gets misplaced. If a setup requires specific hardware or adapters, store them together so the kit is ready to use without hunting for missing pieces.

9. Transporting stored equipment

If you need to move the stored system, keep everything in its protective packaging. Avoid placing heavy objects on top of stored units. Sudden drops, even from a short height, can cause damage that isn't obvious until the next use.
