

## **Dealer Training Materials**

### **Purpose**

The goal is to equip dealers with the knowledge and confidence to sell, support, and maintain the product without relying on constant backend assistance. Good training tightens service quality, reduces repeat issues, and keeps customers happy.

### **What These Materials Should Cover**

Let's break it down into the essentials:

#### **Product Fundamentals**

Dealers need a simple, solid understanding of what the product is, what problems it solves, and how it stands out. This isn't a marketing pitch. It's the core: how it works, where it fits, what it can and can't do.

#### **Operating the System**

They should know the entire workflow—from powering it up to handling advanced functions. The idea is to make them self-sufficient. Clear steps, expected behavior, and what “normal” looks like.

#### **Installation and Setup**

Dealers often handle the first hands-on interaction. They need guidance on mounting, wiring (if any), alignment, calibration, or system pairing. Every step should be predictable and repeatable.

#### **Maintenance Essentials**

A quick rundown of routine inspections, service intervals, and early signs of failure. If they can spot issues early, they save everyone time and warranty costs.

#### **Troubleshooting**

Dealers should be able to resolve the common problems right on the spot. The training material should highlight symptoms, likely causes, and the next best action. The idea is to prevent unnecessary escalations.

#### **Customer Interaction Guidance**

They need to know how to explain the product's value, manage expectations, and communicate limitations in a way that feels honest and confident. This cuts down on friction later.

#### **System Updates and Changes**

When features evolve, dealers should never feel blindsided. They need a clear explanation of what changed, why it matters, and how to show the customer the benefit.

### **Warranty and Service Protocols**

Dealers must understand what's covered, what's not, what documentation to capture, and how to process a claim properly. This protects both sides.
